

AWS EC2 ASSIGNMENT 3

Objectives

- Launch a web server with termination protection enabled
- Monitor Your EC2 instance
- Modify the security group that your web server is using to allow HTTP access
- Resize your Amazon EC2 instance to scale
- Explore EC2 limits
- Test termination protection
- Terminate your EC2 instance

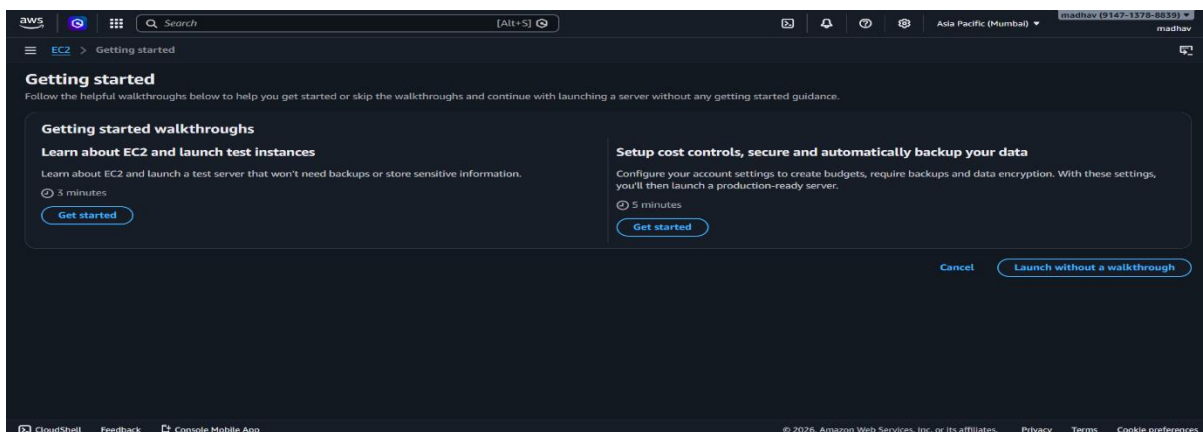

Step 1: Open EC2 Dashboard

You navigated to the EC2 service from AWS Console. This is the starting point to create and manage virtual servers.

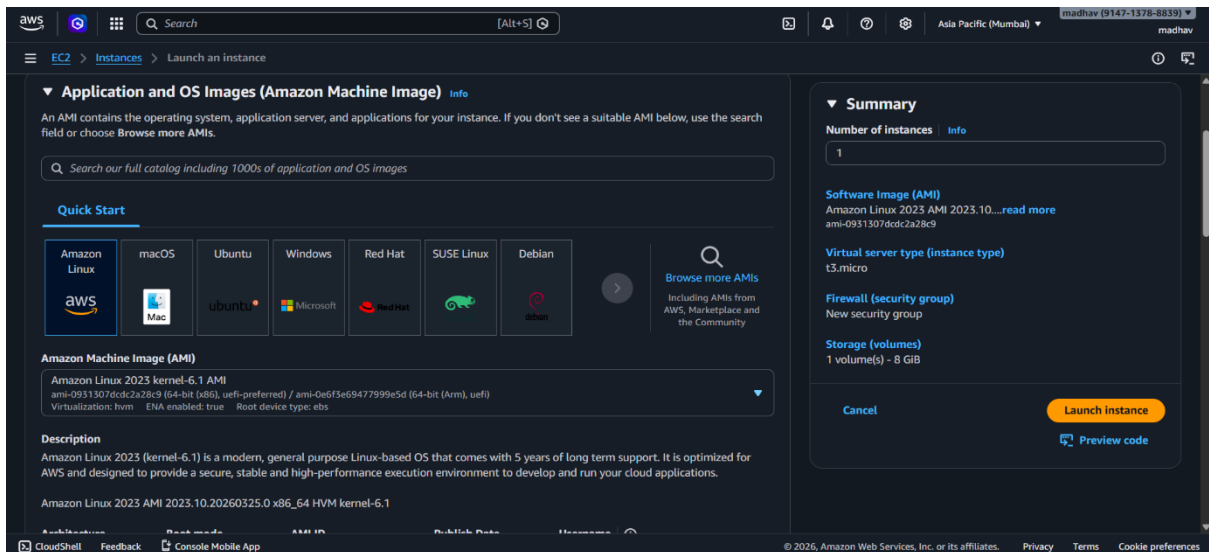

Step 2: Skip Getting Started Guide

You selected Launch without a walkthrough. This allows direct configuration without guided steps.

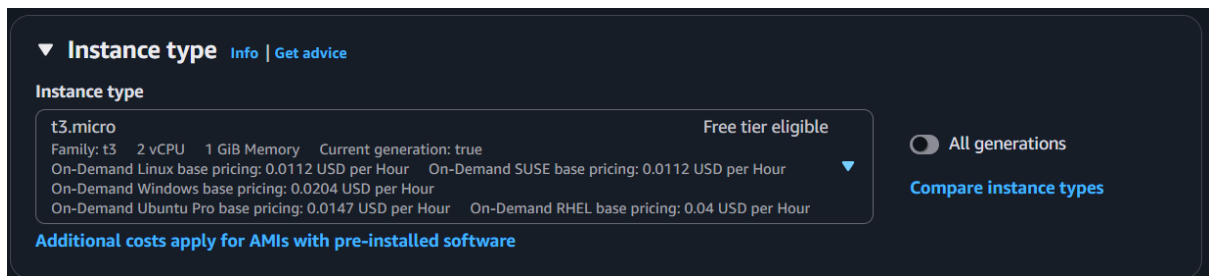

Step 3: Select Amazon Machine Image (AMI)

You chose Amazon Linux 2023 AMI as the operating system. AMI provides the OS and pre-configured environment for the instance.

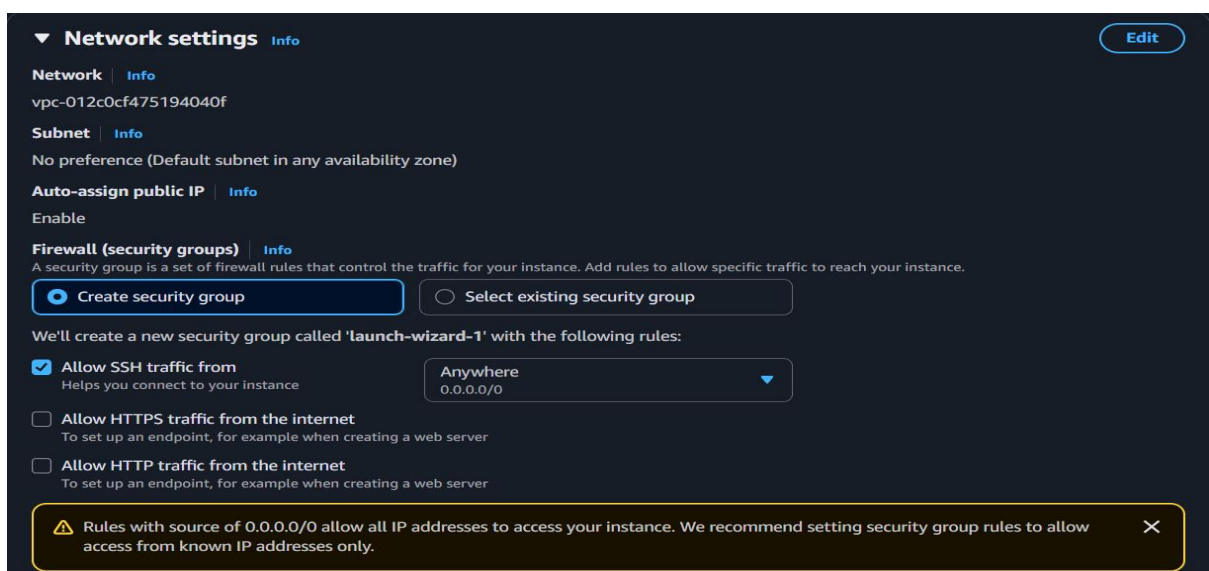

Step 4: Choose Instance Type

You selected t3.micro (Free Tier eligible). This defines the CPU, memory, and performance of the instance.

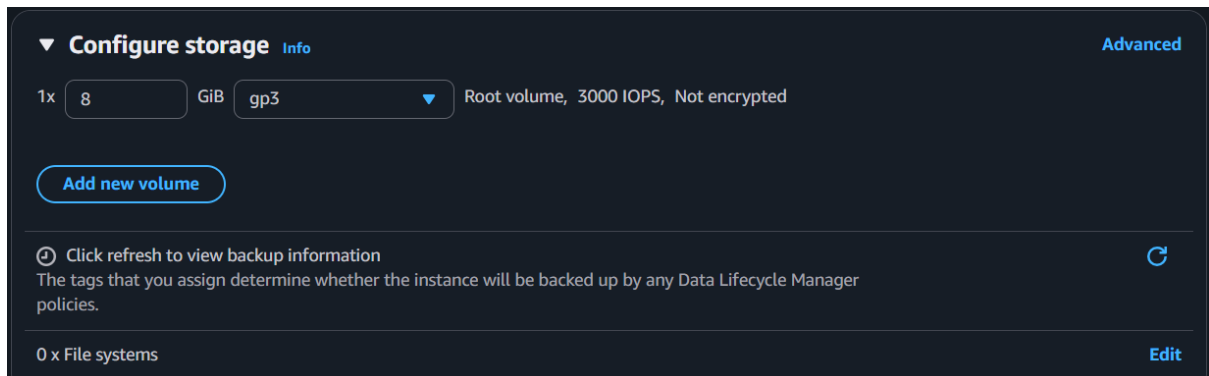

Step 5: Configure Network Settings

You enabled Auto-assign Public IP and created a security group. This allows internet access and controls inbound/outbound traffic.

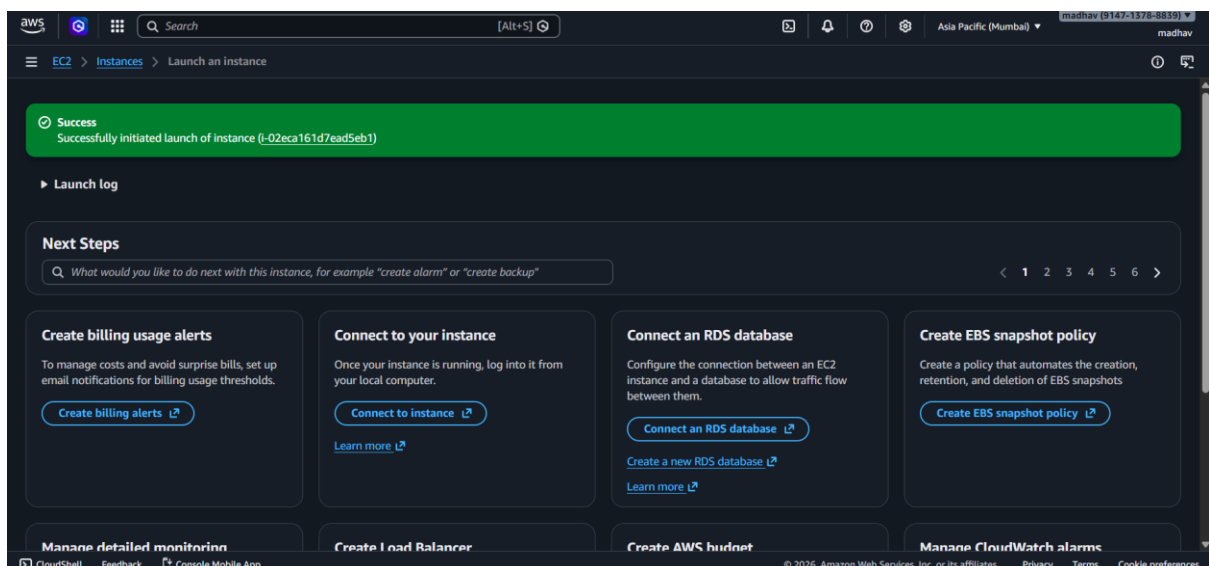

Step 6: Add Storage

You configured 8 GB gp3 storage for the instance. This is the root volume used to store OS and data.

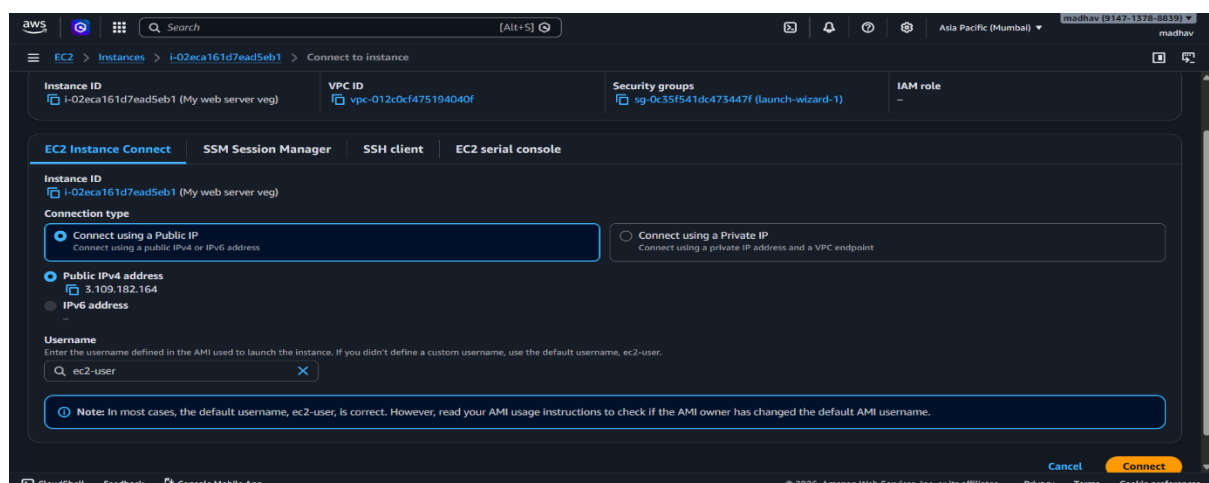

Step 7: Launch the Instance

You clicked Launch Instance to start the server. AWS created and initialized your EC2 instance successfully.

Step 8: Connect to EC2 Instance

You used **EC2 Instance Connect (browser-based SSH)**. This allows direct terminal access without external tools.

Step 9: Verify Connection Using Commands

You ran commands like (pwd) to check the working directory. This confirms successful login and interaction with the server.
